

ABSTRACT

【Summary】

【Object】 Provide an automatic musical performance device, which is capable of giving a concert magic function in an acoustic instrument with a feeling of normally playing the acoustic instrument.

【Solution】 A time period T_v between two points, and a tempo T_{mp} found based on a time intervals between two-point detection and later two-point detection, are found based on detection signals at the two points and later detection signals at the two points; and a delay time $fD(T_v)$, which is from reception of each operating signal by a solenoid activating circuit 20 to commencement of a musical performance of an acoustic piano by the circuit 20, and a velocity value $f_v(T_v, T_{mp})$ are found based on functions. A time period T_a , which starts at the time of later detection S_1 in two-point detection as a reference and ends when a lever 19 is inverted, is found as $f_a(T_v)$ based on a function. Each operating signal is transmitted to the solenoid activating circuit 20 under such timing control that a transmission timing T_{on} comes at a time of lapse of " $f_a(T_v) - fD(T_v)$ " sec after the later detection; and the velocity value is set at $f_v(T_v, T_{mp})$.
